The manual (pre-)cleaning of surgical instruments and products is a prerequisite for successful sterilisation. Given that the range of medical devices to be reprocessed is constantly growing and instruments are becoming increasingly complex, Interlock offers a selection of brushes, cleaners and maintenance products to cover various applications.

- Cleaning brushes which offer optimal price-performance ratio for the most widely used surgical instruments, flexible endoscopes and special reprocessing requirements.
- Interlock's cleaners and maintenance products not only aid reprocessing but also the subsequent care of your instruments.
- Brush sets and cleaning accessories as the perfect addition to the Interlock range

1 Special brushes

The special brushes from Interlock Medizintechnik GmbH are ideal for cleaning the outside surfaces of instruments prior to mechanical cleaning and sterilisation. Regardless of how tough the soiling of your instruments is to remove, with our brushes which come in a wide variety of hardnesses, sizes and shapes, you are sure to find the perfect solution. Even tough-to-remove coagulated blood residue is no longer a problem thanks to the specially designed nylon bristles. The Interlock special brushes are also well suited for cleaning acetabular reamers and removing residue from the joints of needle holders and scissors.

2 Round brushes

Before (pre-)cleaning instruments with narrow channels, such as Frazier aspirators and intramedullary reamers, it is essential to use a round brush which is perfectly matched to the inside diameter. If a brush is selected which is only marginally too thin, then an optimal cleaning result cannot be guaranteed. If, on the other hand, a diameter is chosen which is too large, it is possible that the instrument could be damaged. This is why Interlock offers a range of different round brushes in a variety of lengths. As such, even trocars and valves no longer present a problem. All Interlock round brushes are made of stainless steel wire and premium nylon bristles.

3 Endoscopy brushes

Double-sided cleaning brushes for cleaning endoscope working channels help you to reprocess flexible endoscopes thoroughly. You must ensure that the correct brush is selected to avoid damaging the instrument and to achieve a perfect cleaning result. Interlock Medizintechnik GmbH features an impressive range of brushes. The diverse brush head shapes, diameters and brush lengths are particularly worthy of mention, as are the extremely handy hybrid brushes with a cleaning brush on one end and, for example, a pipe or valve cleaner on the other. There is a small integrated ball on the end of the brush heads to protect the expensive instruments and prevent the inner channels from being damaged by the stainless steel wire.

4 Pipe cleaners

It is often difficult to find suitable reprocessing aids for pre-cleaning ENT and neurosurgery aspirators. Interlock offers just the solution for these tasks in the form of pipe cleaners. In order to satisfy the special medical requirements, the pipe cleaners come in a variety of diameters, lengths, shapes and materials with soft and hard cleaning properties. Cotton and fleece are particularly well suited for gentle cleaning given the soft nature of these materials. Nylon bristles, on the other hand, are better for tough-to-remove residues due to their hardness. Depending on the application requirements, the lengths vary from 20 cm to up to 10 m on a reel. The pipe cleaners are sold in intelligently compiled dispensers to provide users with an ideal range.

5 Brush sets

The wide range of different instruments means that perfectly adapted brushes are always required. The Interlock brush sets provide a basic range of brushes for your day-to-day work. Interlock offers two sets with just round brushes, sets for cleaning cannulae, sleeves and trocars and an all-round set for cleaning most instruments. The sets contain a compilation of brushes of different shapes and diameters.

6 Cleaning accessories

Given that some soiling cannot be removed with brushes alone, the Interlock Medizintechnik GmbH range also includes metal erasers and cleaning pads with excellent cleaning properties.

The Endo CLEAN Sponge offers optimal protection for the storage and transportation of endoscopes. It encompasses the entire distal end, absorbs shocks and impact and does not allow these to be transmitted to the endoscope. It also acts as a useful aid for initial pre-cleaning directly after the examination.

The Interlock brush racks allow you to organise and store your cleaning brushes compactly and close at hand. Plastic versions as well as stainless steel racks are also available.

- A range of diameters, lengths, shapes and bristles of different hardnesses are available.
- Cotton and fleece (soft) are particularly well suited for gentle cleaning due to the soft nature of these materials.
- Nylon mix versions (medium) are better suited for more stubborn residue due to their hardness (integrated nylon bristles between cotton and polyester fibres).
